Torii and Water: A Gateway to Shinto

Hannah Imson, Amy Kahng, Victoria Lekson – Pepperdine University Seaver College

Abstract

Water symbolizes purity in the Shinto religion and thus holds utmost importance as a method of religious purification. Additionally, scholars and worshippers recognize the role of torii as gateways to the kami, or deities of nature. However, there has not been a documented survey of the relationship between torii and their placement in water, a relationship we feel is significant in understanding Shintoism. We intend to bridge this gap in scholarship by displaying the prevalence of torii placed in or right next to water. We will explore torii from various parts of the world as well as different time periods in history. By looking at various torii that are located in water, such as the Itsukushima, Meoto Iwa, Oarai Ibaraki, Shirahige Jinja, and Astuta shrines, we hope to display a significant link between the placement of torii and water as the torii is leading to the highest purity in the spiritual world.

Introduction

A central tenet in Shinto religion is the worship of kami. Torii, the religious gateways of Shintosim, allow the worshipper to enter a space where everything that is natural is holy. Together, cleansing with the water and walking through the torii are believed to purify and prepare the worshipper to be in the presence of kami. We chose to investigate the relationship between these two aspects of Japanese Shintoism because we are intrigued by the interplay of religion and nature, especially water. Torii found in or right next to water, such as the Torii Gate of the Itsukushima Shrine, do not contain a way for the worshipper to cleanse and purify him/herself; instead, placement in or next to water symbolizes purity as it leads to the highest purity in the spiritual world. Our exhibition bridges the gap between the significance of torii in water as well as different time periods in history. By looking at various torii placed in or beside water, we will explore placement in water, a relationship we feel is significant in understanding Shintoism.

Methods

Our exhibition bridges the gap between the significance of torii and water by providing a relationship between two of the most significant aspects in the Shinto religion that have not previously been discussed together. Our sources were picked from those that directly discuss the purity of water in Shinto religion, and woodblock paintings and images that illustrate the placement of torii in or beside water. We also chose various torii from different parts of the world that had been placed in or beside water in order to illustrate the recurring theme of the relationship between the two. The various torii that we are presenting are best studied together as a group because they all illustrate the common theme of torii placement in or beside water. However, we do not feel that this is a huge discrepancy, as both torii point to the body of water as the sacred space.

We examined torii of different importance in order to demonstrate the recurring trend of the importance placement in water plays. For example, the Myijima torii of the Itsukushima shrine is one of the most well-known torii in Japan, and we have comparatively placed it next to the torii at Meoto Iwa, a less accessible torii, in order to exemplify this recurring relationship that occurs even in different levels of “sacredness.” By displaying several artworks of various torii from different time frames and of varying accessibility, we hope to reveal interplay in Shinto worship between the placement of torii and water, thus explaining why there is a significant number of torii placed in bodies of water.

Bibliography

Conclusion and Discussions

The common placement of torii in water does prove to have a special significance in comparison to torii not placed in or near water. At Shinto shrines that have torii not placed in or around water, worshippers must cleanse themselves in a basin after walking through the torii; however, at shrines with torii in or around water, this purification step is unnecessary. Because water, especially salt water, is considered the most pure entity in the Shinto faith, torii and shrines placed in or near water are considered the most pure of all shrines, and thus there is no need for the devotee to cleanse himself before worshiping the kami.

By referencing prints and photographs from different time periods and locations, we have demonstrated that the purity of torii in water is extremely important in the Shinto religion. Torii in or near water have been the focus of artists for centuries, as seen in our exhibitions. Our research could be furthered by actually observing the rituals firsthand at on-land torii versus rituals at in or near water torii. Watching how devotees interact with the different kami could teach us about the purposeful designs of torii and also deepen our argument that torii placed in or next to water are more pure than those located not near water.
